This is a comprehensive test document for the DocumentProcessor. It contains multiple paragraphs to test the chunking functionality. The document processor should be able to load this file, split it into chunks, and provide proper metadata for each chunk. This paragraph discusses various topics including natural language processing, document retrieval systems, and text analysis. The content is designed to be long enough to trigger the chunking mechanism when processed. Here's another paragraph with different content. This helps test whether the chunk boundaries are properly maintained and metadata is correctly assigned. The system should handle various text formats and maintain document structure. Final paragraph to ensure we have enough content for multiple chunks. This tests the complete pipeline from document loading to chunk creation.
